May 2018

Repeater Linking via Mesh

- Linking Networks
- Common Items to all Linking Networks
- Mesh Usage
- Peer-to-Peer Linking
- Show and Tell
- Other Uses for AllStar

Linking Networks

- IRLP
- EchoLink
- AllStar
- D-Star
- DMR
- System Fusion
- HotSpots

Common Items to All Linking Networks

- Generally link repeaters together
- Central Server
- Internet
- Sometimes used to add remote base station/other non-repeaters to the network

Mesh Usage

- Mesh can be used to provide connectivity to/from the Internet from a remote repeater site
- To do this, a custom firewall script must be installed in gateway node (one time)

Peer-to-Peer Linking

- Peer-to-peer linking is linking directly from one repeater to another without needing any central server.
- Only peer-to-peer linking networks known to me:
 - AllStar,
 - Possible DR-2X to DR-2X

Show and Tell

Example of AllStar node on Raspberry Pi

Other Uses for AllStar

- AllStar can also be used as remote base station (with remote rig control via hamlib or dedicated channel steering via gpio pins)
- AllStar can also be used as a PBX with Phone patch access to/from telephone or a network of PBX's
- This PBX functionality can in turn be networked with other PBX's (eg, MeshPhone)

73!

73 and Happy Phoning!
